NOTES : Rams are lotted from oldest to youngest - birth type is born as twin or single, EMD is eye muscle depth at loin, fat is fat depth at loin, wean weights were taken a few weeks after weaning. PWWT is post wean weight. The saliva test is a new test to measure antibodies in a sheeps saliva to determine natural ability to resist worm infestation, the higher count is better. Rams are not shorn, no feet trimmed and grass fed only. Usually we put up fully shed off rams but there were very good good rams that were left out that will likely fully shed off in a few weeks. These rams are bred from classed fully shedding ewes and rams. You can purchase any rams that are not fully shed with confidence that they will shed within a few weeks
